

End-to-end machine learning

MODULE 1

Supervised Machine Learning

Types of machine learning

	Supervised Learning	Unsupervised Learning	Reinforcement Learning
Goal	Predict ...from examples	Describe ...structure in data	Strategize learn by trial and error
Data	(x, y)	x	delayed feedback
Types	<ul style="list-style-type: none">• Classification• Regression	<ul style="list-style-type: none">• Density estimation• Clustering• Dimensionality reduction• Anomaly detection	<ul style="list-style-type: none">• Model-free learning• Model-based learning

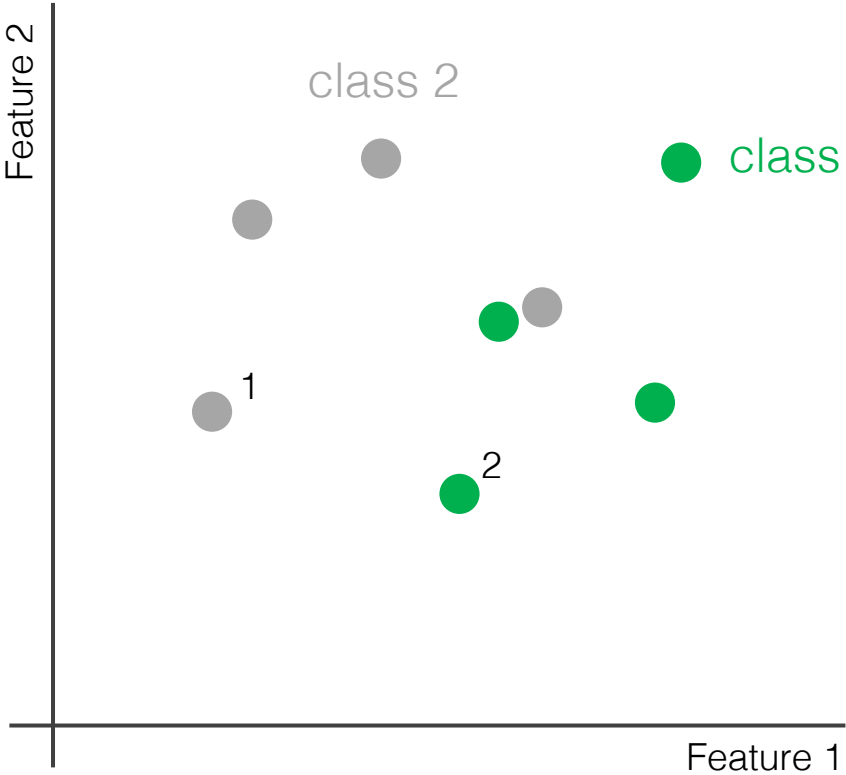

Components of supervised learning

Data

	Feature 1	Feature 2
Data Sample 1	1.6	2.8
Data Sample 2	4.0	2.3
...	###	###

Labels

	Labels
Data Sample 1	Class 1
Data Sample 2	Class 2
...	###

Performance Metric

% of samples correctly classified
(classification)

Mean squared error
(regression)

Supervised machine learning model

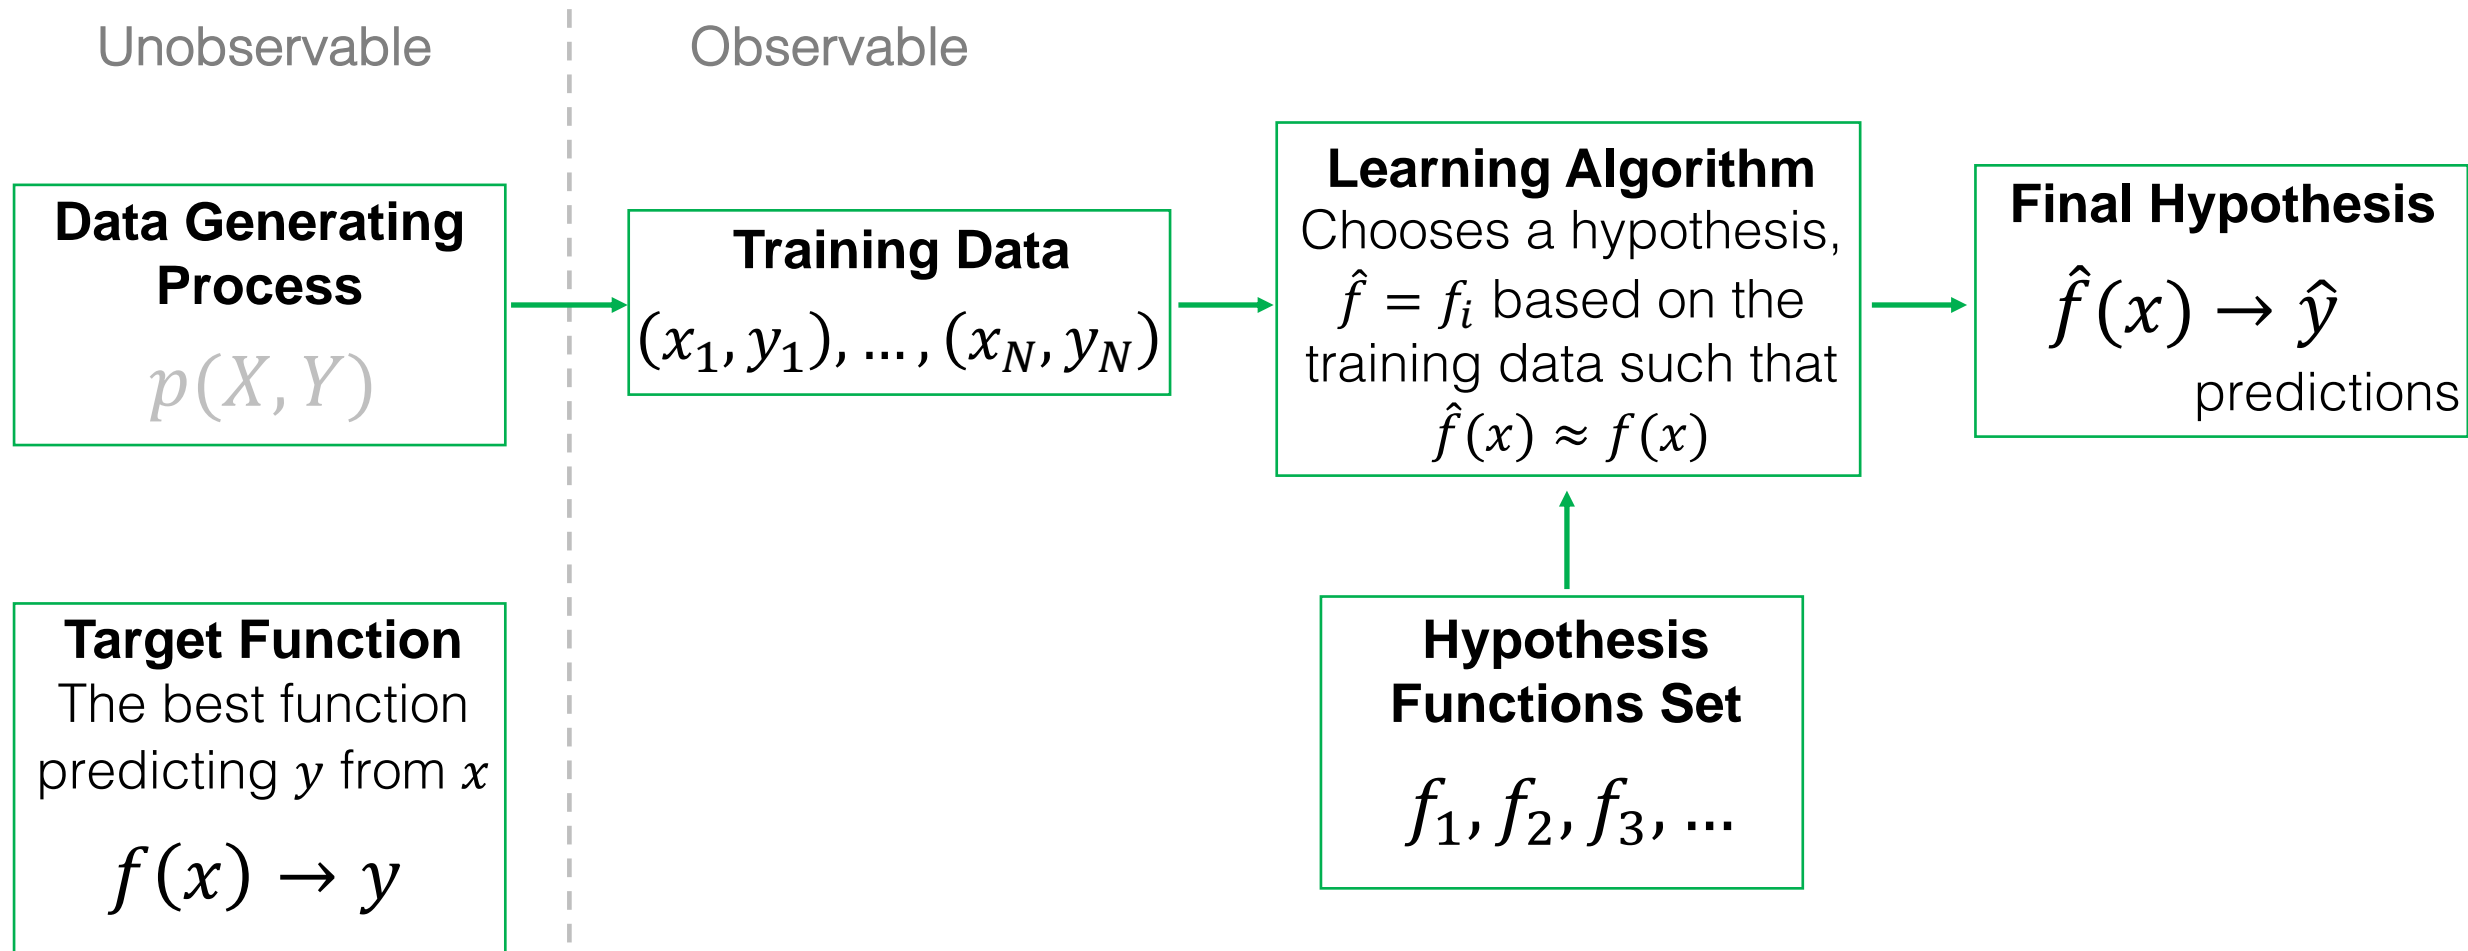

We search for the model that best fits our data

Components of supervised learning

Input	\mathbf{x}	
Output	y	
Training Data	$(\mathbf{x}_1, y_1), (\mathbf{x}_2, y_2), \dots, (\mathbf{x}_N, y_N)$	
Target function	$f(\mathbf{x}) \rightarrow y$	This is unknown, but the best you could ever do
Hypothesis set	$f_i(\mathbf{x}) \rightarrow \hat{y}$	Functions to consider in trying to approximate $f(\mathbf{x})$
Learning algorithm	Optimization technique that searches the hypothesis set for the function f_i that best approximates f (typically by choosing parameters in a model)	

Supervised Learning

- Need to select the hypothesis functions (models to train)
- Need to select the learning algorithm (for fitting the models to the data)

Example: linear regression

Using any line of the form $y = w_0 + w_1x$ as the set of hypothesis functions, how many possible hypothesis functions are in the set?

Infinitely many

Using any line of the form $y = wx$ as the set of hypothesis functions, how many possible hypothesis functions are in this set?

Infinitely many

Which set contains the better hypothesis?

Which set has more options to consider?

What is our learning algorithm?

Next class

Model flexibility and the bias variance tradeoff

End-to-end machine learning

Define the problem

How do we predict the median price of a house in a region?

- What data do we need?
- How do we measure success?

Supervised Machine Learning Process

1. Define your problem, set your goal, and how you will measure success
2. Get the data
3. Explore and prepare the data
4. Propose one or more hypotheses: prospective models
5. Evaluate model performance and iteratively fine tune
6. Deploy your trained model

Deep dive
here

Create training / validation / test data split

Ensure your training data are representative of your test data
(sometimes need to use stratified sampling to avoid sampling bias)

The diagram illustrates the data split process. It consists of three colored boxes arranged horizontally: a green box labeled 'Train', a grey box labeled 'Validation', and a dark grey box labeled 'Test'. Below each box is a description of its purpose. The 'Train' box is green, 'Validation' is grey, and 'Test' is dark grey.

Train

Used for model training / fitting

Validation

Used for model
comparison and
development

Test

DO NOT TOUCH

Used to evaluate
generalization
performance of the
final model

Technical note: don't create a DIFFERENT random sample of the dataset each time you run your code – this will expose your modeling to more of the data and contaminate your train/test split

Quick aside: **Common language on variables**

independent variable

input

predictor

feature

Notice the data seem to be on wildly different scales

Adapted from from Hands-On Machine Learning with Scikit-Learn & TensorFlow by Aurélien Géron

A View feature distributions

Data Visualization and Exploration

1 Values are clipped

Prevents us from making accurate predictions in those cases

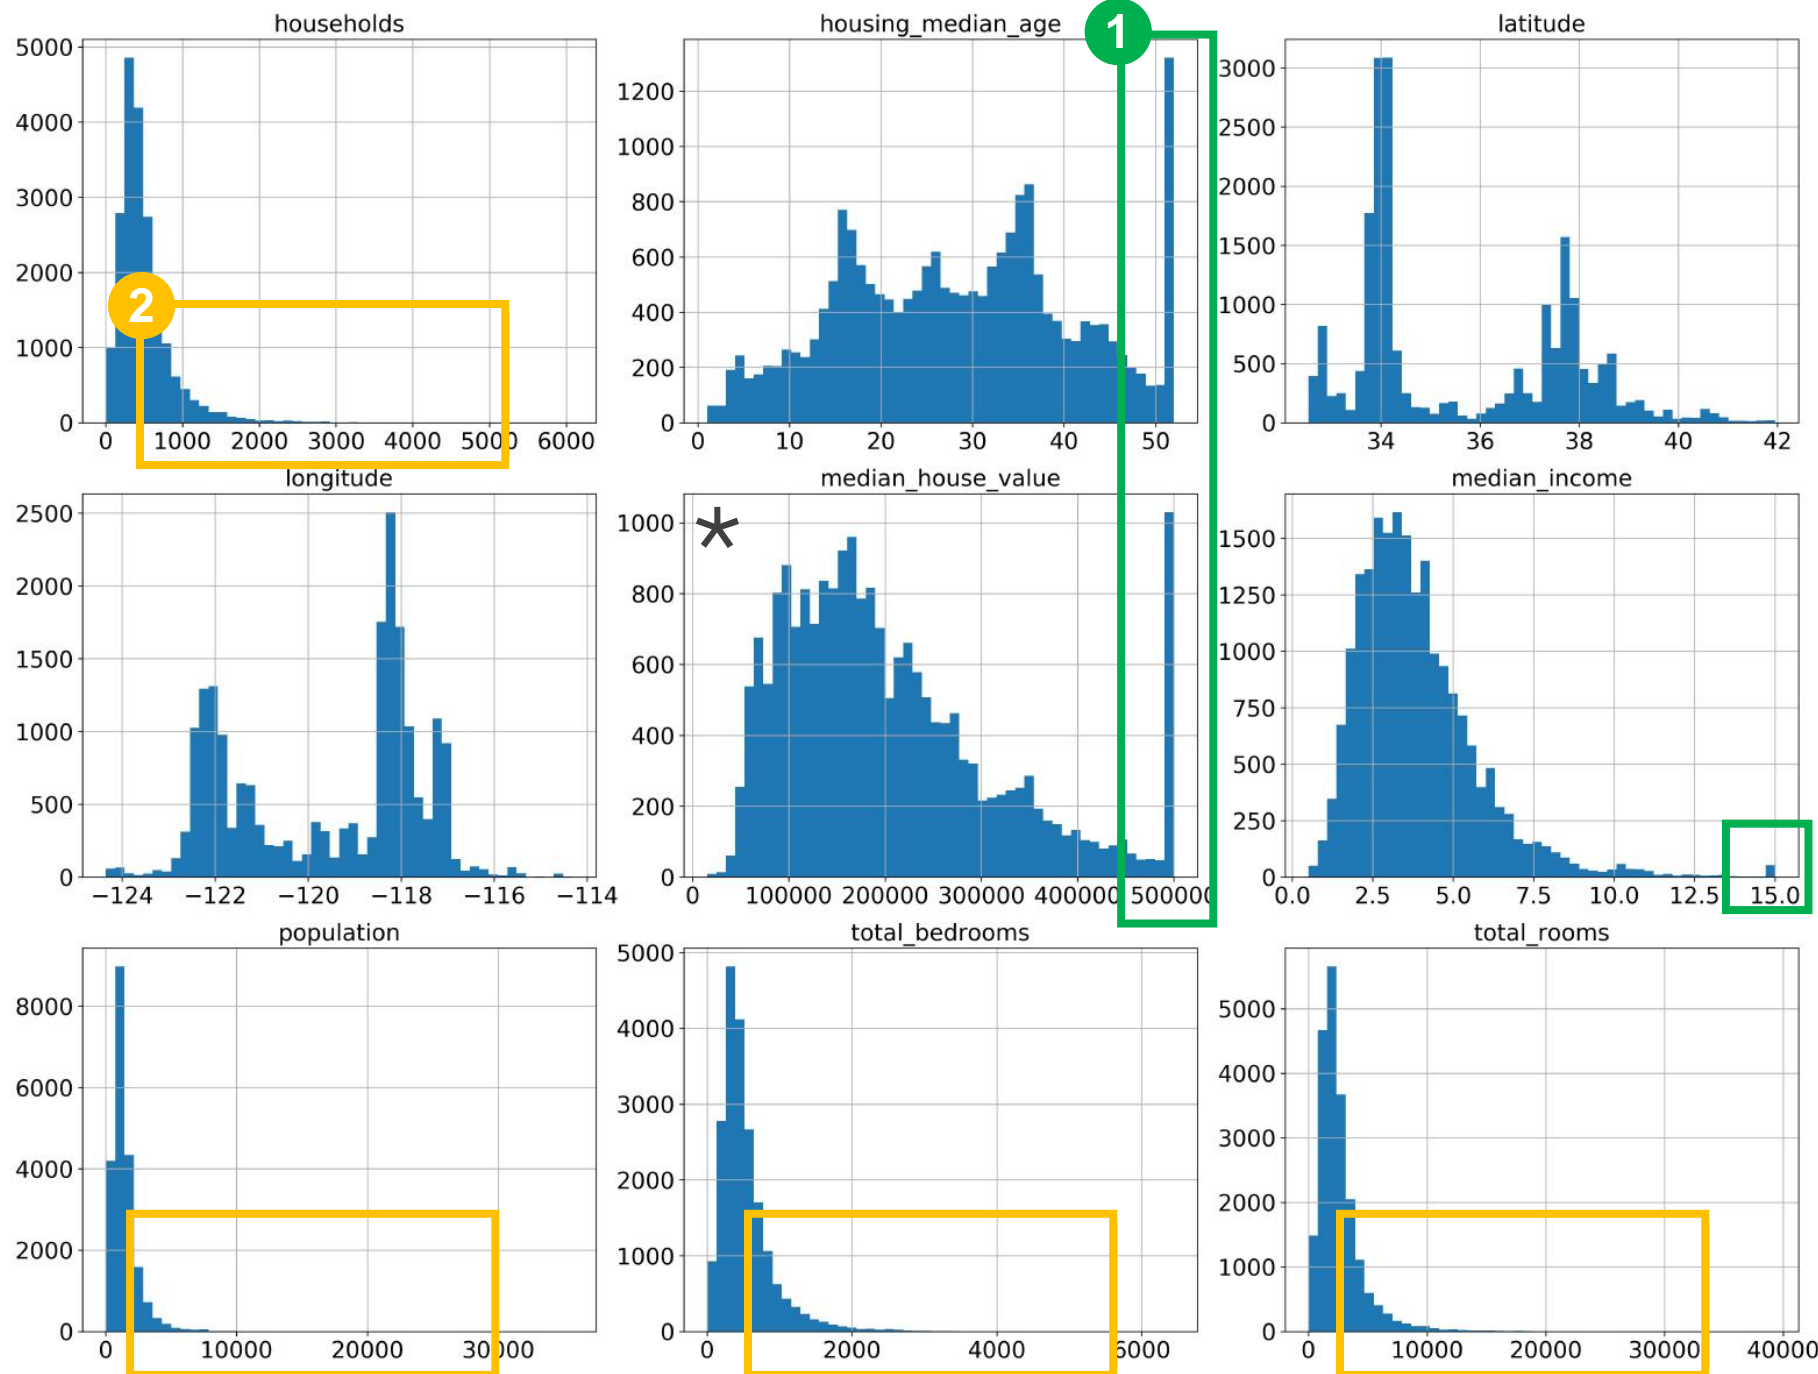

2 Some features are heavy-tailed

Some ML techniques assume normally-distributed data

3 Scale of values

Feature data are on vastly different scales

*= target variable

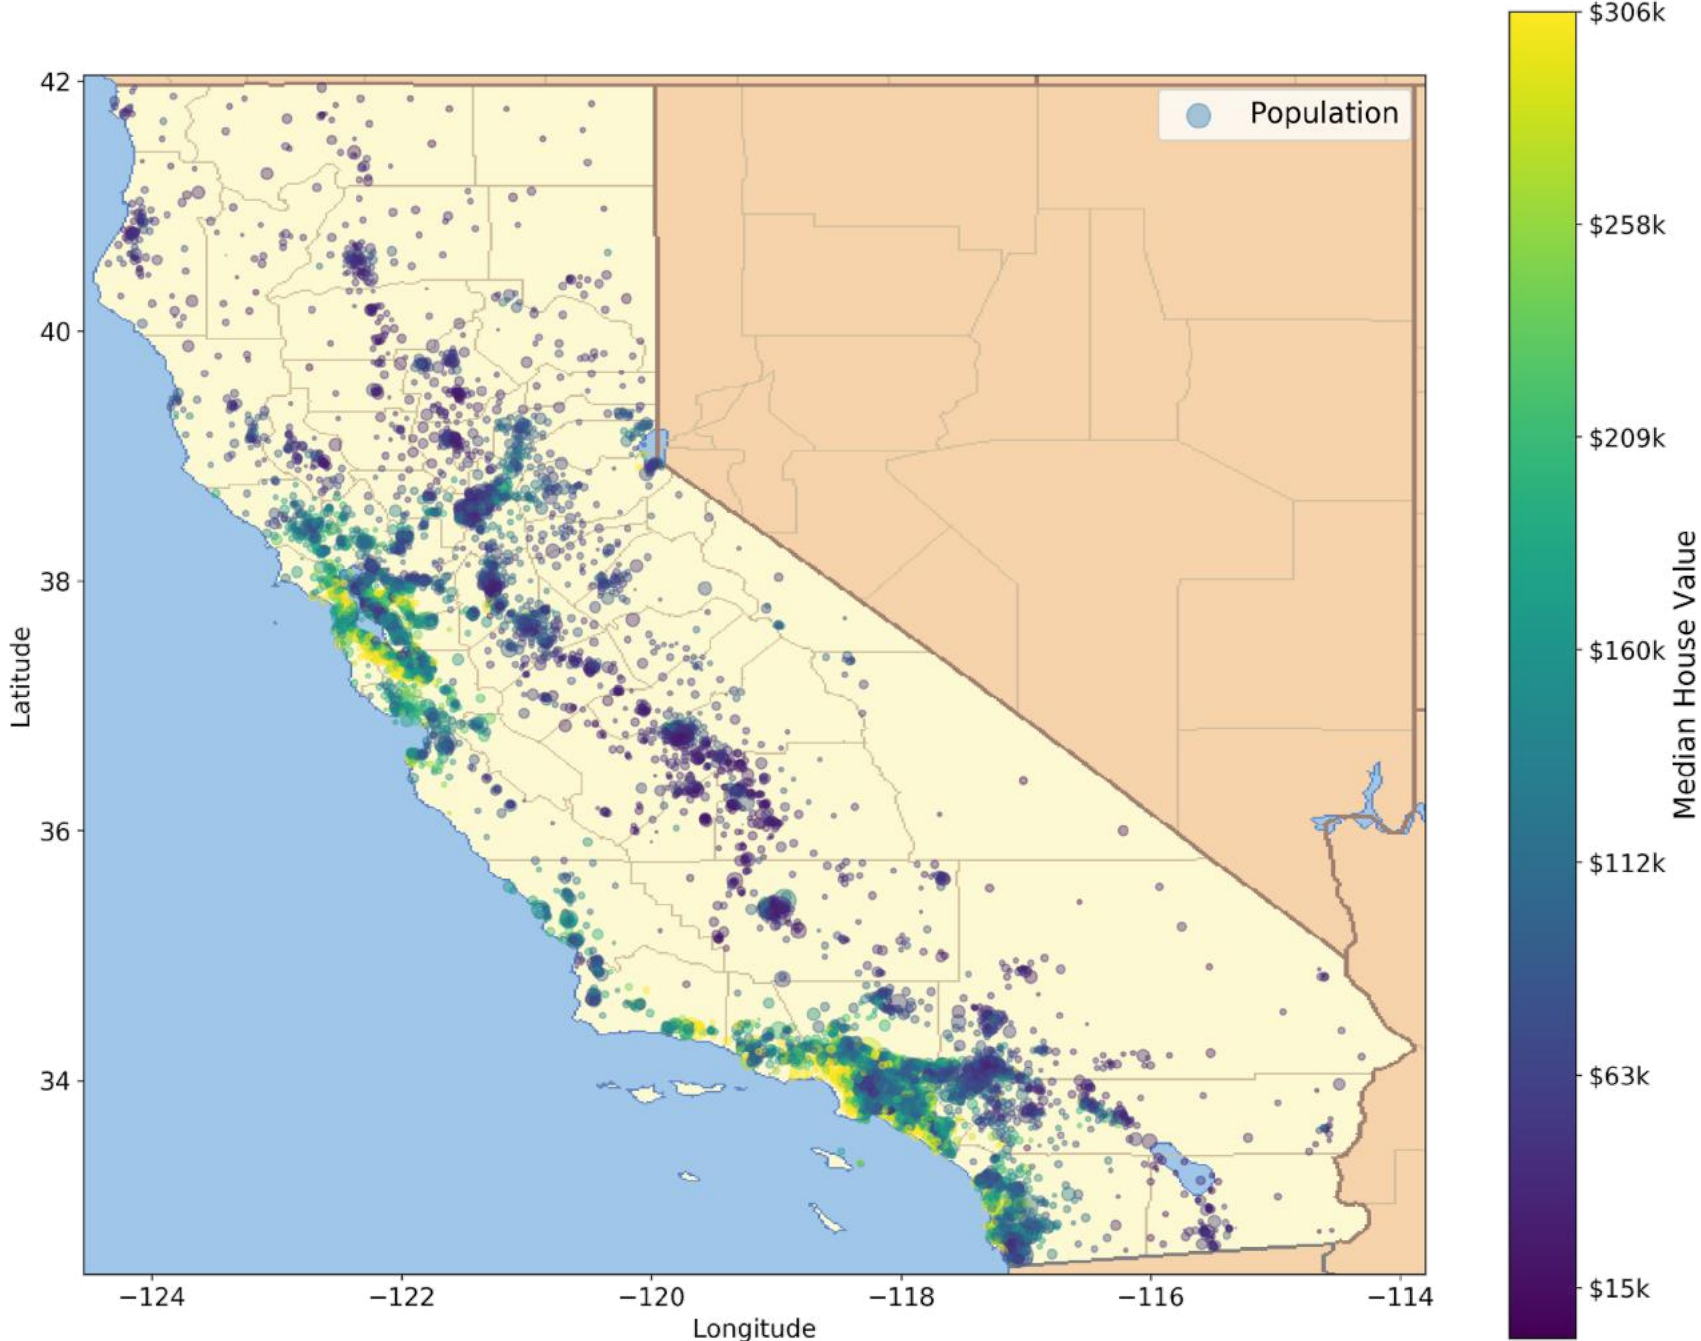

Adapted from Hands-On Machine Learning with Scikit-Learn & TensorFlow by Aurélien Géron

A

Data Visualization and Exploration

View the data spatially for further insights

Adapted from Hands-On Machine Learning with Scikit-Learn & TensorFlow by Aurélien Géron

B Handling Categorical data

Data Cleaning

Recall ocean_proximity has the following categories:

We need to convert this into numerical data to process it

<1H OCEAN
INLAND
NEAR OCEAN
NEAR BAY
ISLAND

1

Assign numbers to each class

Original value	New feature value
<1H OCEAN	0
INLAND	1
NEAR OCEAN	2
NEAR BAY	3
ISLAND	4

What do these numbers mean?

2

Create one binary feature for each category

Original value	F ₁	F ₂	F ₃	F ₄	F ₅
<1H OCEAN	1	0	0	0	0
INLAND	0	1	0	0	0
NEAR OCEAN	0	0	1	0	0
NEAR BAY	0	0	0	1	0
ISLAND	0	0	0	0	1

One-hot-encoding: create a new feature for each category

B Handling missing data

Data Cleaning

total_bedrooms contains missing values

Options:

- 1 Remove samples that have missing values
- 2 Remove features that have missing values
- 3 Fill in (impute) the missing values
 - Fill with average or median
 - Compute a value based on other features

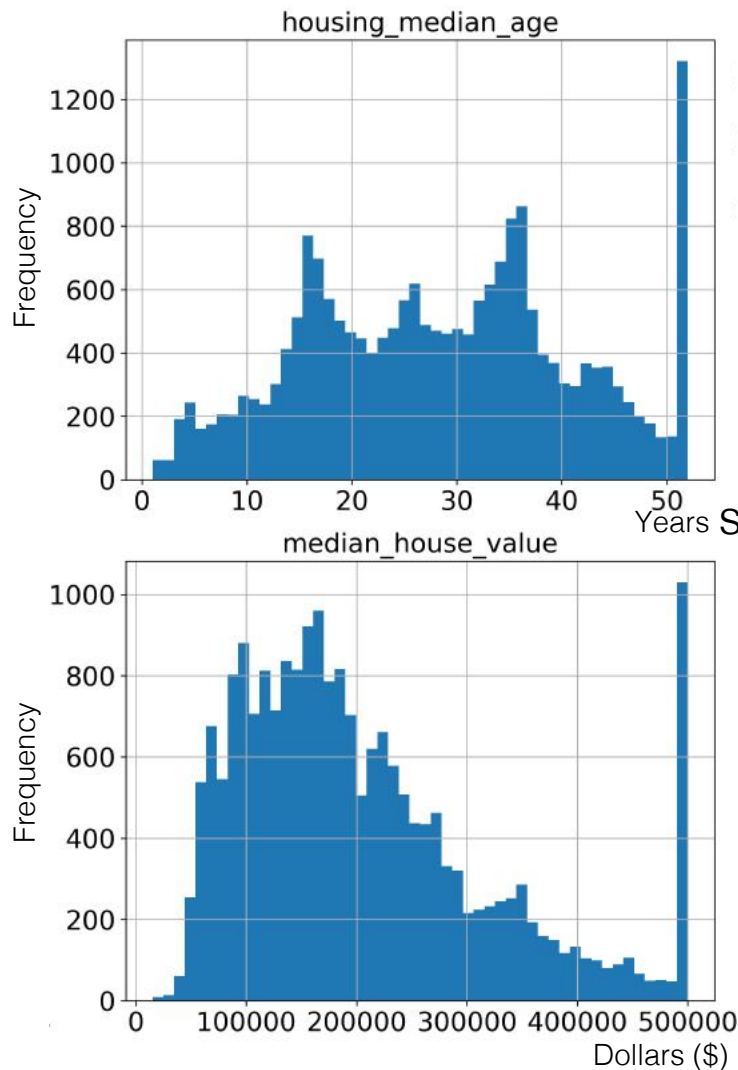

Scaling features

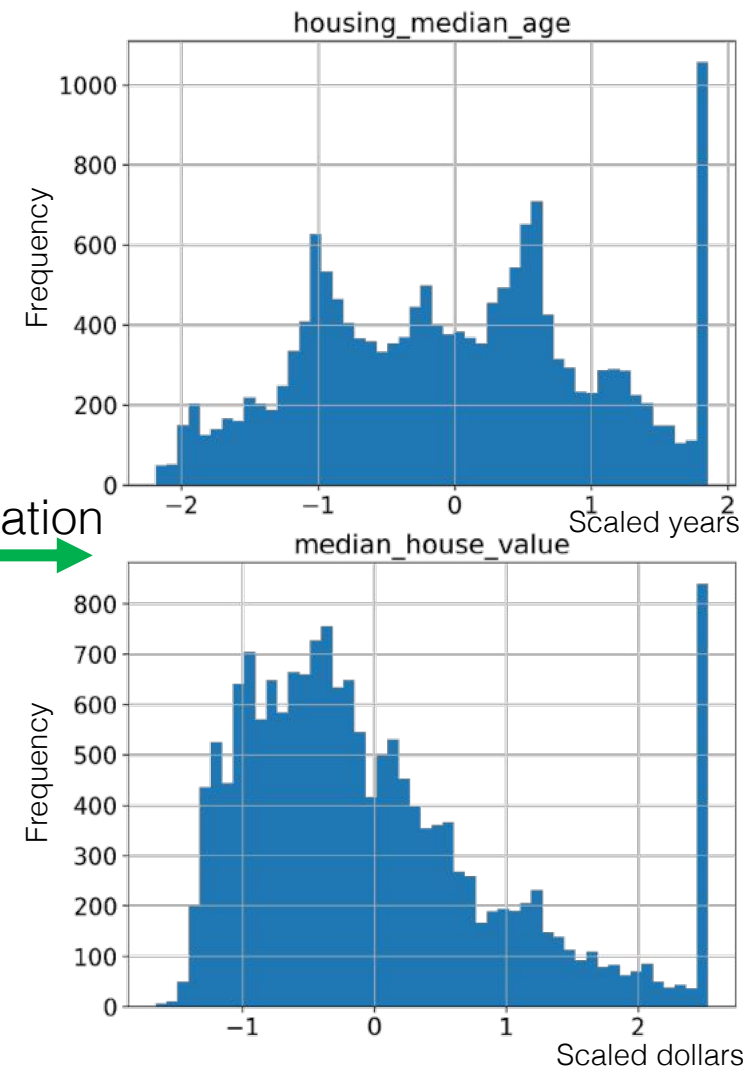

Standardization

$$x^{new} = \frac{x - \bar{x}}{\sigma(x)}$$

Subtract the mean,
divide by the standard
deviation

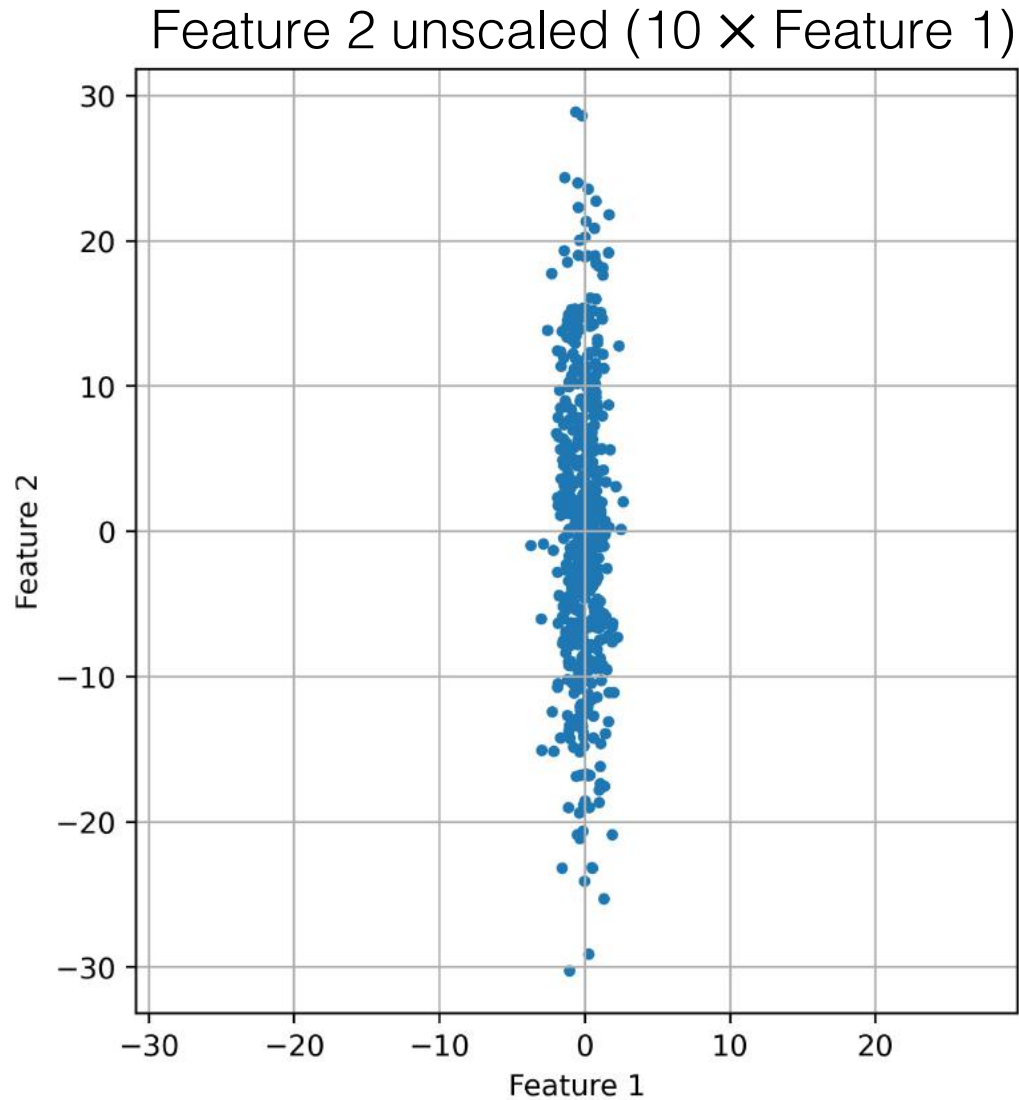

standardization

Why do we care about scaling?

Feature scaling is critical for algorithms that rely on distances between data points

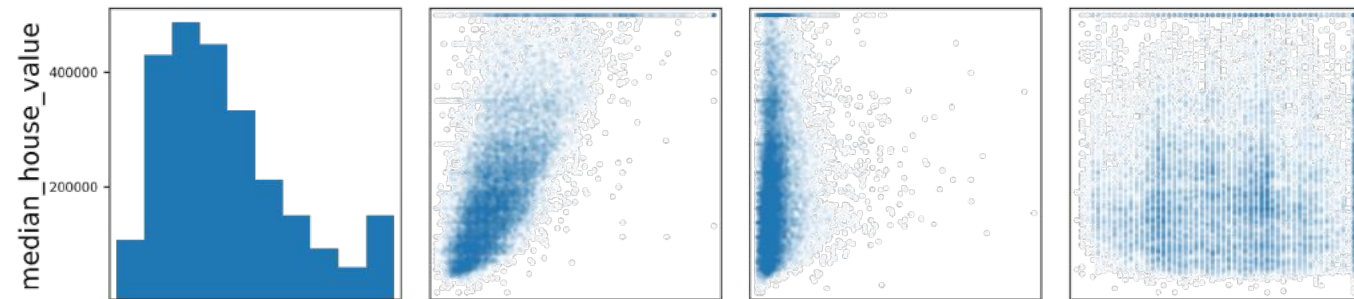

Feature
Extraction

Explore correlations in the data to begin identifying important variables

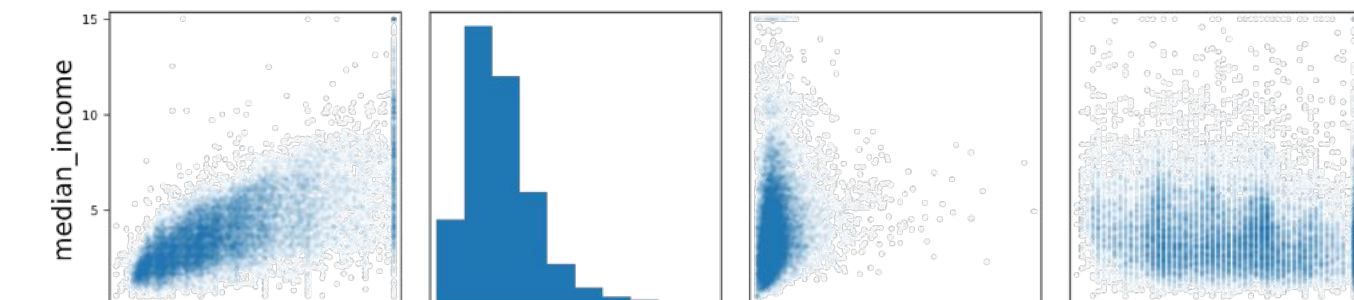

Correlation with our response
variable, median_house_value:

1	median_house_value	1.000000
2	median_income	0.690647
3	total_rooms	0.133989
4	housing_median_age	0.103706
	households	0.063714
	total_bedrooms	0.047980
	population	-0.026032
	longitude	-0.046349
	latitude	-0.142983

1

2

3

4

Adapted from Hands-On Machine Learning with Scikit-Learn & TensorFlow by Aurélien Géron

D

Transform variables (feature engineering)

Feature
Extraction

median_house_value
median_income
total_rooms
housing_median_age
households
total_bedrooms
population
longitude
latitude

$\text{rooms_per_household} = \text{total_rooms} / \text{households}$

$\text{bedrooms_per_room} = \text{total_bedrooms} / \text{total_rooms}$

$\text{population_per_household} = \text{population} / \text{households}$

Resulting correlations:

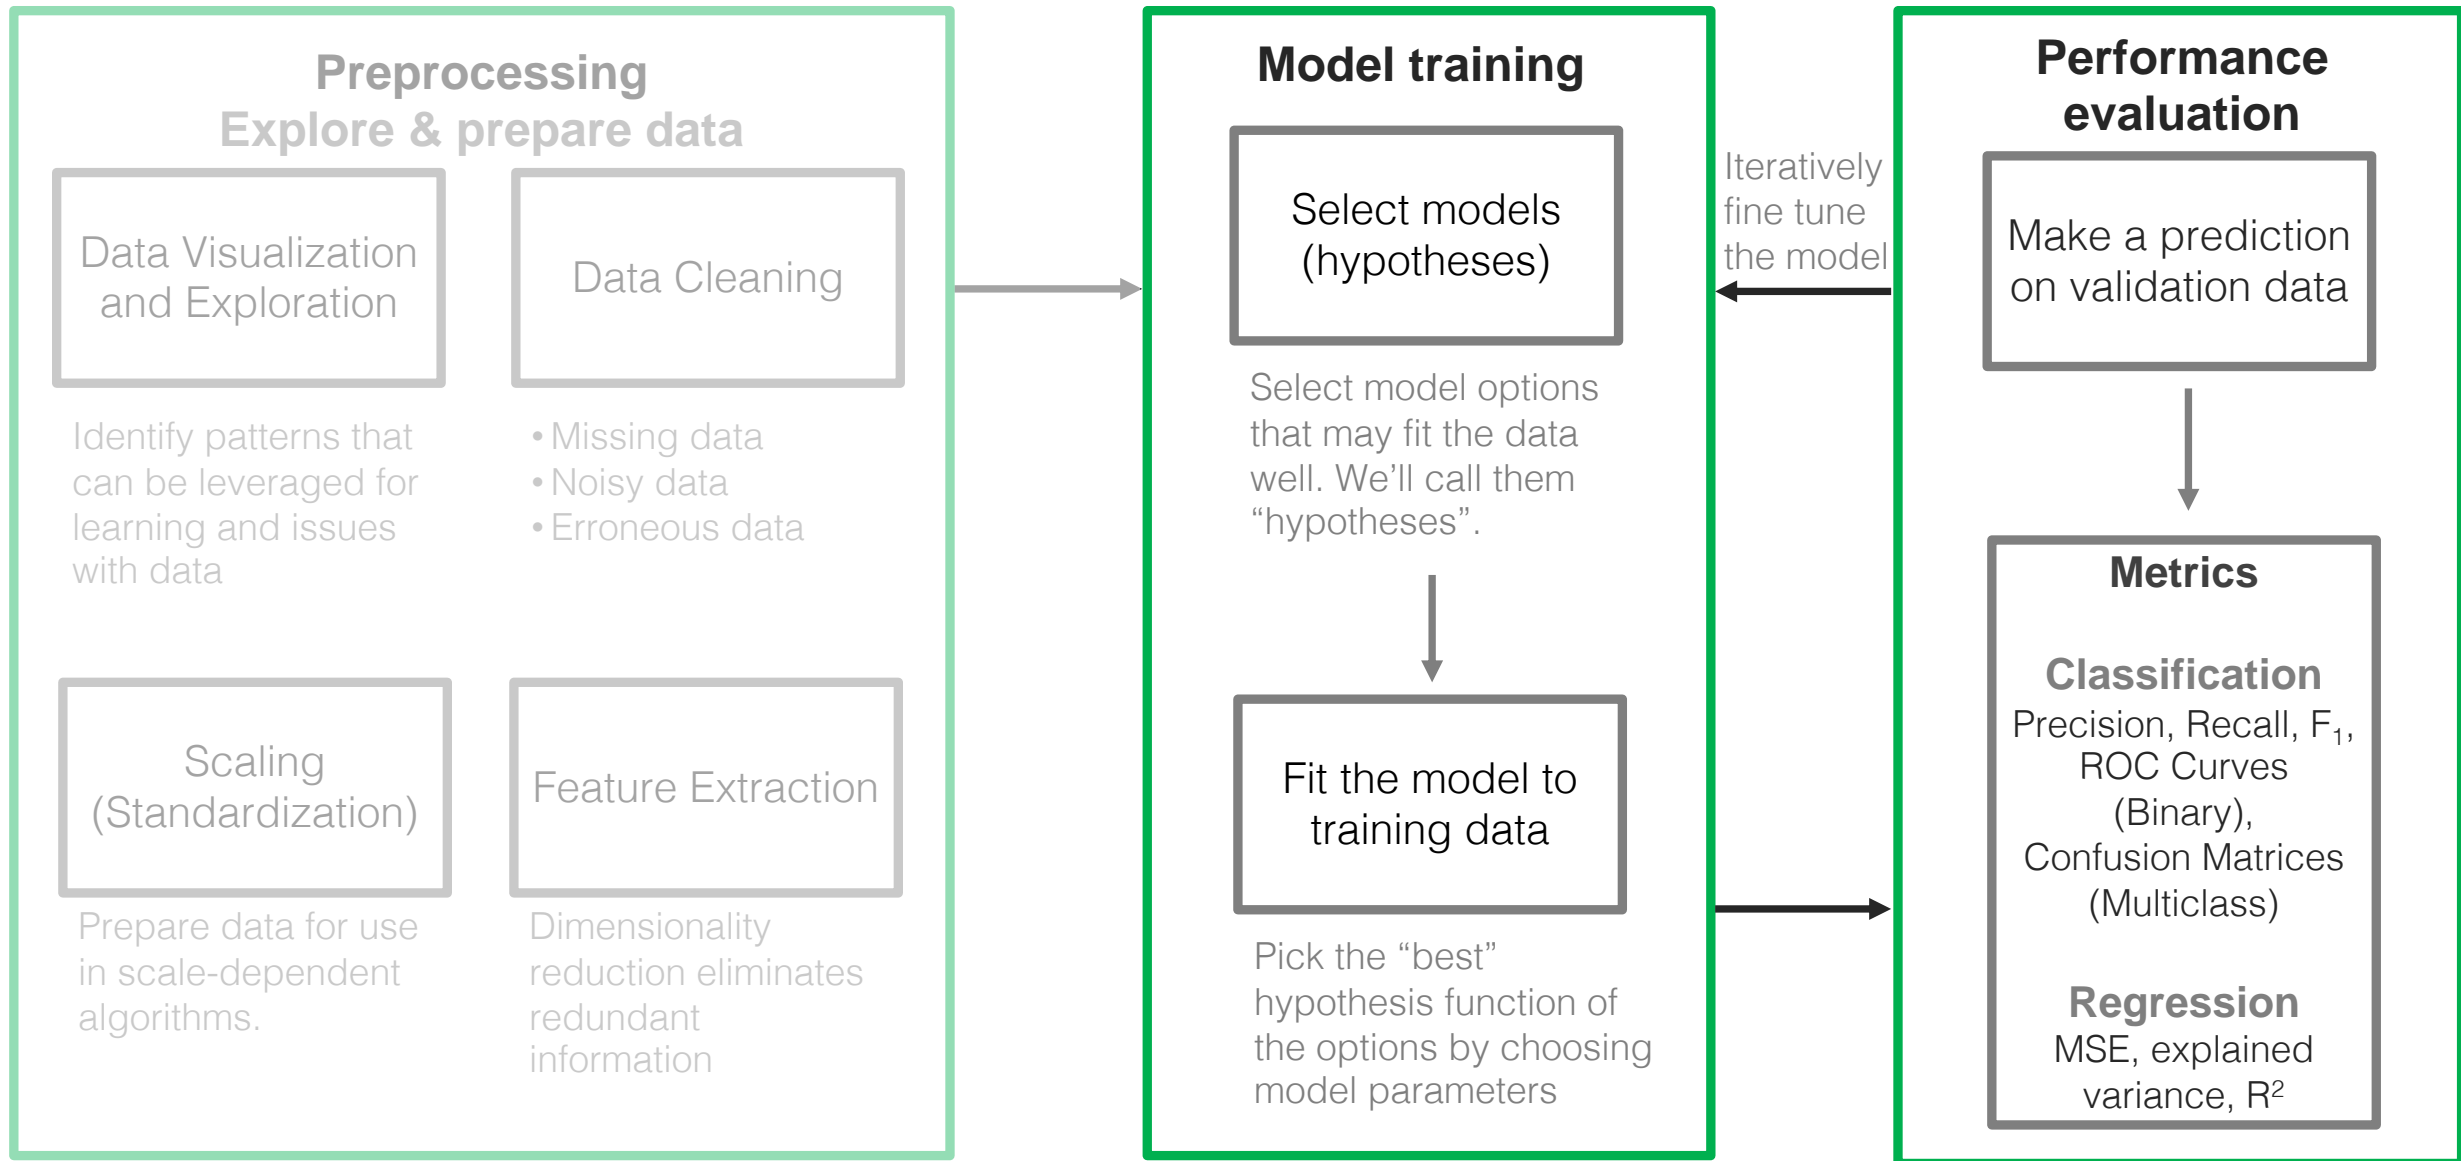

median_house_value	1.000000
median_income	0.690647
rooms_per_household	0.158485
total_rooms	0.133989
housing_median_age	0.103706
households	0.063714
total_bedrooms	0.047980
population_per_household	-0.022030
population	-0.026032
longitude	-0.046349
latitude	-0.142983
bedrooms_per_room	-0.257419

Preprocessed data

- Divided our data into training and testing sets
- Viewed the data and looked for problems
- Engineered new features that have real-world meaning
- Categorical data transformed into binary features (1-hot-encoding) enabling ML techniques
- Missing values replaced (imputed)
- Features standardized (now have zero mean and std of 1)

We're ready to train a machine learning model and evaluate performance

Supervised learning in practice

Model Training Considerations

Model Selection

K-Nearest Neighbors
Linear regression
Logistic regression
Linear Discriminant Analysis
Naïve Bayes
Classification and Regression Trees
Random Forests
Support Vector Machines
Neural Networks

We will spend the first half of the course on these pieces

Other Considerations

Combine models through ensembles (bagging, boosting, stacking)

Selecting cost functions

Regularizing our models to avoid overfit

Selecting model hyperparameters through grid search, random search, or Bayesian optimization

Experiment with three models

Validation data performance

Model	Root Mean Square Error RMSE (\$)	RMSE / Median Home Price * 100 (%)
Linear regression	68,628	38.1
Random forest	52,564	29.2
Random forest with feature selection	49,694	27.6

Once we have a model we are confident in, we can evaluate our generalization performance on our **test set**:

Test set performance	47,766	26.5
----------------------	--------	------

Operationalizing the solution

Now the code needs to be run at scale
(production-grade code, production environment)

The ML solution will need to be maintained and updated
(Update the codebase, update model with new data)

Continued monitoring of accuracy will be required
(check for model drift – are distributions changing?)

How fast does it need to run?
(i.e. in real-time)

Supervised Machine Learning Process

1. Define your problem, set your goal, and how you will measure success
2. Get the data
3. Explore and prepare the data
4. Propose one or more hypotheses: prospective models
5. Evaluate model performance and iteratively fine tune
6. Deploy your trained model
